PRESTIGE

There is no “true” perfection. It does not exist in human beings nor does it exist in the things that surround us, so let us accept and respect the natural specificities of forests, the same way we accept each other. We must embrace and value the beauty of defects that are inherent in the nature as such.

“ (IM)PERFECT OAK

Just like humans, trees are not perfect either. If we focus on a particular tree species, let us say oak, we will find in its structure a number of defects, such as knots and cracks. But, can we really say that these irregularities are faulty?

Wood has always been a valued construction material and remains an essential element in the future as well. In the past, trends moved in the direction of uniformity and the use of such types of wood and synthetic materials that made this possible, but today we are again inclined to the natural state of things. Wood became synonymous for rekindling our connection to nature, domestic comfort, and the feeling of homeliness and warmth. The faults in the wood, let us call them 'beauty mistakes',

are an expression of wilderness, at the same time emphasizing its unique nature and characteristics. We need to devote our care and attention to it, and raise the awareness of its true value.

There is no "true" perfection. It does not exist in human beings nor does it exist in the things that surround us, so let us accept and respect the natural specificities of forests, the same way we accept each other.

THE FAIRYTALE LARCH

The LARCH tree is the only conifer that loses its needles in the winter. A walk through a larch forest is truly something remarkable. Because the crowns let a lot of light through, such forest is quite bright. That's why the larch veneered door is well suited for bright spaces with contemporary design. Larch wood is dense, heavy and durable, which means that the products we create have guaranteed durability and strength.

The old folk tradition says that forest fairies used to live in larch forests. It was those fairies who wanted to cheer up the larch when it wished that its needles would dance in the wind like the leaves of other trees. The needles of the larch turned into soft green leaves. It was all well, until the storm came down from the mountains, broke its branches and tore up its leaves. The larch then asked the good fairies to restore its needles. But as a reminder, the larch only received such leaves that turn gilt each autumn, and fall off like the leaves of deciduous trees. Because they love the larch forest, the fairies are said to still live there.

With a good selection of larch wood products, the good fairies will settle in your home, too.
